-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 13 June 2005.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-42 is/are pending in the application.
- 4a) Of the above claim(s) 9-12, 29 and 30 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-8, 13-28, and 31-42 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Status of claims*

Claims 1-42 are currently pending. Claims 9-12, 29, and 30 have been withdrawn.  
Claims 1-8, 13-28, 31-42 remain rejected as stated infra.

### *Response to Arguments*

Applicant's arguments filed 6/13/2005 have been fully considered but they are not persuasive.

In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). Since a scan lens having an external entrance aperture is taught by Dixon, it is not necessary for Engelhardt (which does disclose a lens for scanning and, hence, "a scan lens") to teach such an element for the combination to meet the claimed limitations.

In response to applicant's argument that the optical system of Engelhardt will not work if used in the present invention nor is properly combinable with the Dixon reference, the test for obviousness is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference or the disclosed invention of the applicant; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the test is what the combined teachings of the references would have suggested to those of ordinary

Art Unit: 2872

skill in the art. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981). Specifically, Engelhardt is cited for the teaching that a focus lens is moved for fine focusing in a scanning system.

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, motivation can be found in Engelhardt which states:

This invention is based on the objective of designing and developing an optical system in the light path of a microscope, specifically a confocal scanning microscope, such that continuous depth discrimination and optimal matching of to the objective, wavelength, and transmission can be accomplished with simple means in the minimum construction (col. 1, lines 54-60).

Applicant's argument that, "Applicant's invention is clearly distinguishable from Dixon and Engelhardt [since] no one has used a fine focusing lens with a scan lens prior to the Applicant doing so in the present invention," and "...if it were obvious to use a focusing lens for movement relative to the scan lens, then it is respectfully submitted that would have been done some time ago," fails to comply with 37 CFR 1.111(b) because it amounts to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references.

*Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 8, 14, 16/1, 16/2/1, 16/3/1, 17/1, 17/2, 17/3, 17/6, 18/1, 18/2/1, 18/3/1, 19/1, 19/2/1, 19/3/1, 20/1, 20/2, 20/3, 20/6, 21/1, 21/2/1, 21/3/1, 23/1, 23/2/1, 23/3/1, 24/1, 24/2/1, 24/3/1, 26/1, 26/2/1, 26/3/1, 27, 39/1, 39/2/1, 39/3/1, 41 and 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dixon et al. (US Patent No. 5,532,873) in view of Engelhardt et al. (US Patent No. 6,285,019).

With respect to claim 1, Dixon et al. discloses an imaging system for imaging objects, said system comprising: (a) an illumination source (102) producing a light beam (103) directed upon an optical path toward an object (130); (b) a scan lens (302) for focusing said light beam to a diffraction-limited configuration in a prescribed object plane, said scan lens having an external entrance pupil (304); (c) a scanner (114, 120) for scanning said light beam to move said diffraction-limited configuration in a pre-determined scan pattern on said object plane (col. 4, lines 38-62); (d) said scan lens (302) being movable relative to said object to achieve coarse focusing (col. 4, line 63-col. 5, line 14); (e) a focusing lens (108, 136, 200, etc.); and (f) a detector (156) located to receive light from said object plane and a display (412) to produce a signal from said detector (fig. 3a). Though Dixon et al. teaches a focusing lens may be placed at different positions depending on the focal length of the lens used, Dixon et al. does not expressly disclose a focal lens being movable relative to said scan lens to achieve fine focusing. However,

Art Unit: 2872

the moving of focusing lenses to adjust the focus of a microscope is old and well known in the art. Engelhardt et al. teaches an objective lens system for a confocal scanning microscope wherein a lens focus (8) is moved relative to a scan lens (11) for fine focusing (fig. 1). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of Dixon et al. and Engelhardt et al. to provide an imaging system with a focus lens movable relative to a scan lens for a variety of reasons including allowing the system to continuously scan an object in three dimensions without having to object relative to the microscope objective during scanning (Engelhart col. 2, lines 51-56).

With respect to claim 2, Engelhart et al. discloses the scan lens is in a fixed position relative to said object during fine focusing (col. 2, lines 51-56). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of Dixon et al. and Engelhardt et al. to further limit the required operation of the imaging system.

With respect to claim 3, Dixon et al. and Engelhardt et al. show a focusing lens is located between the object (130) and the light source (102) (fig. 3a).

With respect to claim 4, Engelhart et al. Dixon et al. show the focusing lens is located between a light source (2) and a detector (3). Here, since it is generally understood that the figures show are a schematic of the optical arrangement, location is read to follow the path of the light beam. Thus, the path of the light beam begins with the illumination source and ends with the detector as shown in both Dixon et al. (fig. 3a) and Engelhardt et al (fig. 1).

With respect to claim 5, Engelhardt et al. discloses a focusing lens (8) is located between a detector (5) and a scanner (10) (fig. 1). At the time the invention was made, it would have

Art Unit: 2872

been obvious to a person of ordinary skill in the art to combine the teachings of Dixon et al. and Engelhardt et al. to provide this optical arrangement to vary the optically effective pinhole diaphragm diameter (abstract).

With respect to claim 8, Dixon et al. discloses the system is a confocal imaging system and there is a detection arm (138, 136) located between said scanner (114, 120) and said detector (140), said detection arm receiving light from said diffraction-limited configuration in said object plane, said detection arm having a pinhole (138) and a focusing lens (136) to obtain a focal point for confocal detection of said light returning from said object, said detector being located behind said pinhole, there being a beamsplitter (112) located between said detection arm and said object, said beamsplitter directing light returning from said object into said detection arm (fig. 3a).

With respect to claim 14, Engelhardt et al. discloses the system is constructed to allow fine focusing during operation of said system to image said object (col. 2, lines 51-56). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of Dixon et al. and Engelhardt et al. to allow for fine focusing to be able to carry out continuous depth discrimination (abstract).

With respect to claim 16, Dixon et al. discloses the scan lens (400) is a telecentric  $f^*\theta$  scan lens (fig. 4a).

With respect to claim 17, Dixon et al. discloses the detector can be a spectrally resolved detector (col. 3, lines 34-46).

With respect to claim 18, Dixon et al. discloses there are means for supporting (208) said object (130) to be imaged (fig. 3a).

With respect to claim 19, Dixon et al. discloses there is a support (208) for said object (130) to be imaged, said support being capable of moving said object relative to said system (col. 3, lines 4-5).

With respect to claim 20, while Dixon et al. does not expressly a second condenser lens and transmission detector, such transmission arrangements are well known in the art and often interchanged with reflection arrangements. At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to modify the reflection system of Dixon et al. to provide the necessary components for a transmission system including a condenser lens and transmission detector. One would have been motivated to do this for imaging of transparent or partially transparent samples.

With respect to claims 21 and 39, Dixon et al. discloses said illumination source (102) is a laser (fig. 3a).

With respect to claim 23, Dixon et al. implies the system is configured to be controlled by a computer (col. 4, lines 58-63).

With respect to claim 24, Dixon et al. discloses the imaging system is a macroscope and said system can be operated to image an object in reflected light, transmitted light, fluorescence, photoluminescence or multi-photon fluorescence (abstract).

With respect to claim 26, Dixon et al. discloses said diffraction-limited configuration is one of a spot or a line (col. 4, lines 46-49).

With respect to claim 27, Dixon et al. discloses said system has a beam expander (104, 106, 108), said beam expander being located to expand said light beam prior to said light beam entering said beamsplitter (112) (fig. 3a).

With respect to claim 41, Dixon et al. discloses a method of imaging an object using an imaging system having an illumination source producing a light beam directed along an optical path towards said object, a scan lens having an external entrance pupil for focusing said light beam to a diffraction-limited configuration in a prescribed object plane, a scanner for scanning said light beam to move said diffraction-limited configuration in a pre-determined scan pattern on said object plane, a detector being located to receive light from said object plane and a display to produce a signal from said detector, as discussed supra regarding claim 1. Further, Dixon et al. teaches a method comprising moving said scan lens relative to said object to coarse focus said system (col. 3, lines 3-4). Dixon et al. is silent to subsequently maintaining said scan lens in a fixed position relative to said object and moving a focusing lens relative to said scan lens to fine-focus said system. However, Engelhardt et al. teaches such a step is desirable. At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of Dixon et al. and Engelhardt et al. to maintain the scan lens in a fixed position relative to the object and move a focusing lens relative to the scan lens to fine-focus the system to allow the system to scan an object without having to object relative to the microscope objective during scanning and to adjust the light incident upon the detection pinhole relieving the need of a micromechanical system (col. 2, lines 51-67).

With respect to claim 42, the combination of Dixon et al. and Engelhardt et al. discloses or suggests the limitations of claim 42 as discussed supra regarding claim 41. The combination further discloses the imaging system having a laser as an illumination source. While the combination is silent to the intensity of said laser being controllable, such control is inherent to all laser systems since some degree of control over intensity can always be exhibited by

Art Unit: 2872

switching the laser on and off. Also, the examiner notes that the limitation, "to use said system as an imaging system and as a laser guided surgery or microsurgery system" is an intended use type limitation. A recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claimed limitation. See *In re Casey*, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 136 USPQ 458, 459 (CCPA 1963).

*MC*  
8/19/2005

Claims ~~6/4/1, 6/5/1~~<sup>6</sup><sub>A</sub>, 8, 15/1, 15/2/1, 15/3/1, 22/1, 22/2/1, 22/3/1, 28, 31/1, 31/2, 31/3, 31/6, 32/1, 32/2/1, 32/3/1, 33/1, 33/2/1, 33/3/1, 34/1, 34/2/1, 34/3/1, 35/1, 35/2/1, 35/3/1, 36/1, 36/2, 36/3, 36/6, 37/1, 37/2, 37/3, 37/6, 38/1, 38/2, 38/3, 38/6, and 40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dixon et al. (US Patent No. 5,532,873) in view of Engelhardt et al. (US Patent No. 6,285,019) and in further view of White et al. (US Patent No. 6,169,289).

With respect to claims 6 and 40, the combination of Dixon et al. and Engelhardt et al. discloses all the limitations of claims 4 and 5. Neither reference specifically discloses the imaging system is a multi-photon or two-photon system. However, White et al. discloses a multi-photon or two-photon system may be used for fluorescence microscopy. At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of White et al., Dixon et al., and Engelhardt et al. to provide an imaging system capable of multi-photon or two-photon excitation for the best imaging of fluorescent objects.

With respect to claim 8, while Dixon et al. and Engelhardt et al. are silent to an immersion lens, White et al. discloses the scan lens is a liquid-immersion scan lens and shows there is an immersion liquid between the scan lens and the object when the system is operational (fig. 1). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to modify the teachings of Dixon et al. with the arrangement of White et al. “to enhance the collection of the fluorescent photons from the specimen...” (col. 6, lines 8-9).

With respect to claim 15, Dixon et al. discloses the scan lens may be a telecentric  $f^*\theta$  scan lens (400) (fig. 4a). The modification to a liquid immersion scan lens has been described supra regarding claim 7.

With respect to claims 22 and 28, White et al. discloses a laser rejection filter (not shown) is placed in front of a detector (35), said imaging system being a multi-photon or two-photon imaging system whereby an illumination source (11) is a short pulse laser to excite multi-photon or two-photon fluorescence respectively in a object (22) (col. 5, line 47-col. 6, line 45). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to modify the teachings of Dixon et al. and Engelhardt et al. with the arrangement of White et al. to provide maximum resolution for the imaging system.

With respect to claim 25, White et al. discloses said immersion liquid is one of water or oil (col. 6, lines 44-46).

With respect to claims 31-35, White et al., Dixon et al., and Engelhardt et al. disclose all the limitations of claims 1-3 and 6 and variety of possible uses for the imaging system. The combination as disclosed above teaches or suggests all the structure needed to meet the limitations of claims 31-35. The examiner notes that these claims include limitations that are

Art Unit: 2872

intended use-type limitations. A recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claimed limitation. See *In re Casey*, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 136 USPQ 458, 459 (CCPA 1963).

With respect to claims 36-38, Dixon et al. discloses the light source is a laser and the object is a semi-conductor. The White et al. teaches a laser intensity being adjustable and controllable for a multi-photon or two-photon system (col. 2, lines 51-67). (See the reject supra regarding the further intended use-type limitations.) Though the references are silent to the photon energy being related to bandgap energy of a semi-conductor, it is well known that that a photon energy smaller than the bandgap energy may be used in multi-photon illumination. Therefore, at the time of the invention, it would have been obvious to one of ordinary skill to provide this photon energy for proper imaging of a semi-conductor sample.

Claims 7 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dixon et al. (US Patent No. 5,532,873) in view of Engelhart et al. (US Patent Application No. 2003/0103263) and in further view of Guerra (US Patent No. 5,349,443).

With respect to claim 7, Dixon et al. and Engelhardt et al. teach or suggest all the limitations of claim 1 as stated supra. Dixon et al. and Engelhardt et al. are silent to the limitations of claim 7. Guerra discloses the scan lens is a liquid immersion scan lens and there is an immersion liquid between said scan lens and said object when said system is operational. At the time the invention was made, it would have been obvious to a person of ordinary skill in the

art to modify the teachings of Dixon et al. with the arrangement of Guerra to provide a larger numerical aperture improving the image quality.

With respect to claim 13, Guerra shows a sidewall (36) surrounding objective lens (10'), said sidewall extending between said scan lens and said object (S), said sidewall having a substantial sealing relationship with said scan lens and said object to retain said immersion liquid (32) of said liquid-immersion scan lens between said scan lens and said object (fig. 13). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to modify the teachings of Dixon et al. and Engelhardt et al. to provide a sidewall to contain the immersion liquid. One would be motivated to do this to allow for easy application and containment of the immersion liquid.

### ***Double Patenting***

Claims 1-3, 7, 8, 13-15, 18, 21, 22, 25, 26, and 41 of this application conflict with claims 1, 2, 7, 9, 11-13, 19, 20, and 22 of Application No. 10/608,217. 37 CFR 1.78(b) provides that when two or more applications filed by the same applicant contain conflicting claims, elimination of such claims from all but one application may be required in the absence of good and sufficient reason for their retention during pendency in more than one application. Applicant is required to either cancel the conflicting claims from all but one application or maintain a clear line of demarcation between the applications. See MPEP § 822.

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686

Art Unit: 2872

F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-3, 7, 8, 13-15, 17, 18, 20, 21, 22, 25, 26, and 41 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1, 2, 7-13, 19, 20, and 22 of copending Application No. 10/608,217 in view of Engelhardt et al. (US Patent No. 6,285,019).

With respect to claims 1 and 7, Application No. 10/608,217 claims almost all the same limitations in claim 1 including an imaging system for imaging objects, the system comprising: (a) an illumination source; (b) a liquid-immersion scan lens; (c) a scanner; (f) a detector and a display. Engelhardt et al. teaches an objective lens system for a confocal scanning microscope wherein a scan lens being movable relative to an object to achieve coarse focusing and a focusing lens is moved relative to a scan lens for fine focusing. At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to modify claim 1 of Application No. 10/608,217 with the teachings of Engelhardt et al. to allow the system to scan an object in three dimensions without having to object relative to the microscope objective during scanning.

Likewise, with respect to claims 2, 3, and 14, Engelhardt et al. teaches these further limitations and would be obvious to modify claim 1 of Application No. 10/608,217 to meet these limitations for reasons stated supra.

Also, claim 8 is an obvious variation of the structure provided by claim 2 of copending Application No. 10/608,217.

Further, claims 13, 15, 18, 21, 25, and 26 state the same limitations as claims 13, 7, 9, 11, 20, and 19, respectively, of copending Application No. 10/608,217.

Finally, claim 41 is an obvious combination of claims 1 and 22 of copending Application No. 10/608,217 and the Engelhardt et al. reference for reasons stated supra.

This is a provisional obviousness-type double patenting rejection.

### *Conclusion*

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mark Consilvio whose telephone number is (571) 272-2453. The examiner can normally be reached on Monday thru Friday, 8:30 am to 5:00 pm.

Art Unit: 2872

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Drew Dunn can be reached on (571) 272-2312. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
